

About Aptroid Consulting (India) Pvt Ltd (Division of Zeta Global – Product Development Company):

Aptroid Consulting (India) Pvt Ltd is a Web Development company focused on helping marketers transforms the customer experience increasing engagement and driving revenue, customer data to inform and drive it in every interaction in real time and with each individual behavior possibly. In today's consumer market, Aptroid marketers provide more sources than any other vendor allowing them to capture customer behavior to make them easily the most unique in the level of leverage behaviors that helps to automate the mutual giving an almost unlimited number of choices in advertising - the company has the best-in-breed technology solutions for marketers is committed to allow synchronization. Email and marketing automation with strong roots, Aptroid provides advertising and more engaging experiences for customers, which has evolved to provide efficient processes for business. A multi-channel customer behavior and leverage automation to capture the strong foundation of the e-mail exchange rates with most appropriate tools and techniques to drive customer communication and expand its focus. Easily the most unique marketing company that can automate interactions built on top of a strong base with the best features of email marketing and marketing automation. Aptroid provides marketing programs for some of the world's leading proprietary trading assets and capabilities of the forces at the end of the company's portfolio. Expertise encompassing all digital marketing channels - email, display, social, search and mobile.

Role: Deep Programming, Systems Thinking & AI-Driven Engineering

Location: Hyderabad

About the Role

We are looking for exceptional young engineers who possess strong analytical ability, deep programming understanding, and a genuine passion for how technology works under the hood. This role is not about knowing a single framework or tool — it is about the ability to think, reason, understand systems deeply, and intelligently leverage AI to amplify productivity and innovation.

If you are someone who understands programming deeply and also knows how to use AI to think faster, build better, and push boundaries — this role is for you.

What You Will Do

- Design, develop, and optimize high-performance software components
- Solve complex engineering problems through strong logic and structured thinking

- Work with core data structures, algorithms, concurrency, and memory concepts
- Understand internal program behavior, execution models, and system interactions
- Build production-grade backend / platform / distributed systems
- Use AI tools responsibly to improve coding efficiency, debugging accuracy, design quality, and learning speed
- Continuously learn and adapt to new technologies, tools, and programming paradigms
- Participate in design discussions, performance analysis, and code reviews

What We Are Looking For – Must Have

- Strong analytical and problem-solving mindset
- Deep understanding of programming concepts (beyond syntax)
- Clarity on:
 - Program execution model, stack vs heap, runtime behavior
 - Data Structures & Algorithms
 - Operating System fundamentals
 - Concurrency basics
 - Performance thinking and trade-offs
- Curiosity-driven engineering mindset
- Strong fundamentals in at least one programming language
- Ability to leverage AI tools (Copilot / Claude etc.) to think better, research faster, debug smarter, and produce higher-quality engineering outcomes — as augmentation, not dependency

Nice to Have

- Understanding of compilation vs interpretation / JVM / memory models
- Exposure to threads, processes, I/O, networking basics
- Participation in coding contests / open-source contributions / serious personal projects
- Internships / research exposure
- Strong mathematical reasoning background

- Experience using AI for code generation, debugging, documentation, architecture thinking, or learning acceleration

Who Should Apply

- You care about how and why systems work, not just how to code them
- You enjoy deep technical thinking and solving intellectually challenging problems
- You believe AI is a powerful amplifier — not a shortcut — and you know how to use it well
- You want to become a strong backend / systems / platform engineer
- You want to build a long-term, high-impact technical career

Why Join us

- Work closely with highly skilled senior engineers & architects
- Build a world-class engineering foundation
- Exposure to real-world scalable systems and complex problem spaces
- Strong learning culture with AI-powered engineering workflows
- Growth path toward senior engineering, platform engineering, and architecture leadership

Share your resume along with:

1. Programming projects or GitHub links
2. Any AI-powered engineering work (optional but valued)
3. A short note on a technical concept you explored deeply and why it fascinated you

Pre-requisites:

- B. Tech (CSE/IT) – 2027 Passed out
- Should have 60% aggregate throughout their career
- Willing to work in International time zones (US/UK)
- Willing to give 2 years' commitment to the company
- **Ready to join immediately.**

CTC: INR 800,000 to 100,000 PA + Benefits (Cab – drop & Food) (CTC depends upon their performance during interview)

Stipend 45,000/- (During Internship).
